

Digital Transformation

**Modernize the Present and
Simplify the Future with Cisco**

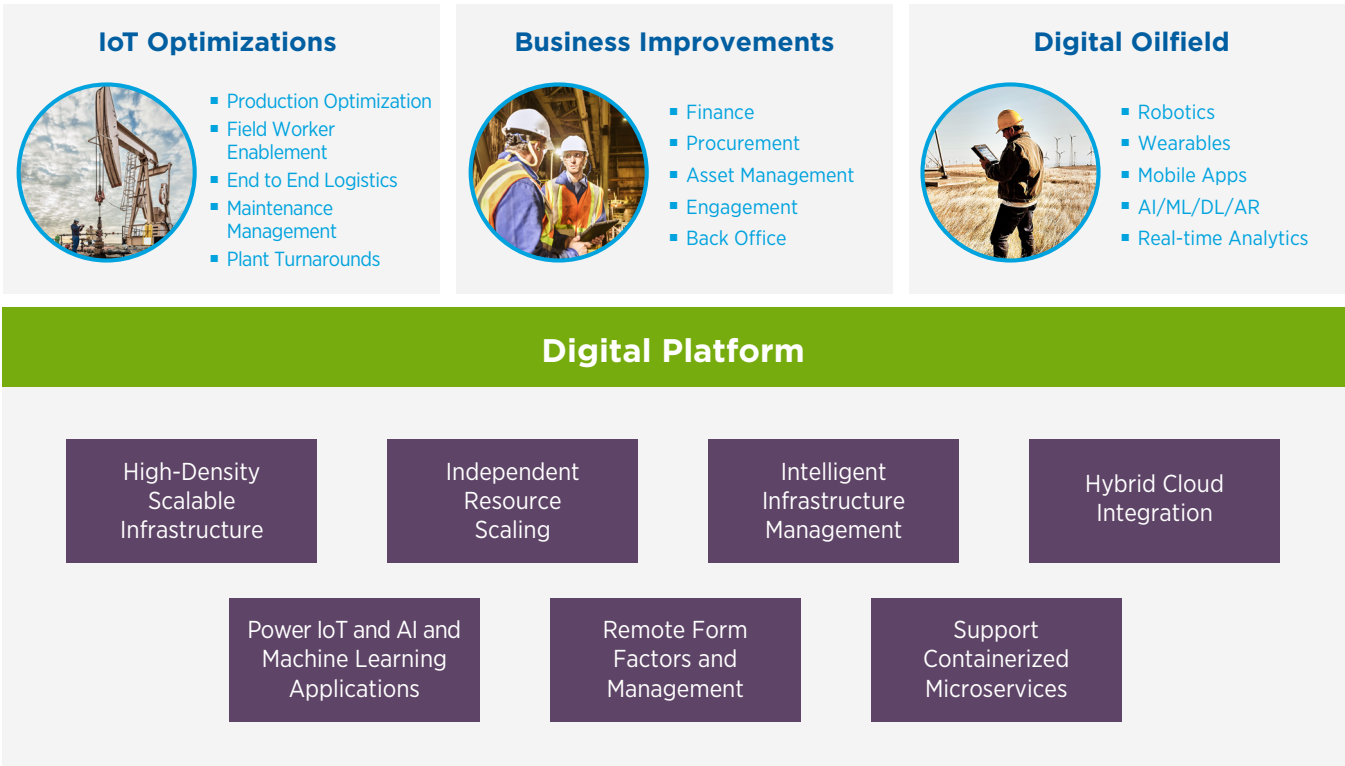

Digital transformation starts with modernization

An enterprise-wide digital transformation can deliver new levels of innovation that can transform entire operations from “the reservoir to the retail pump.” The first step in this transformation is the modernizing of IT infrastructure onto new digital platforms that can deliver cloud-like flexibility, agility, and economics. Most importantly, these platforms need to deliver benefits for current applications as well as future ones that will continue to drive transformation.

Building a digital platform infrastructure

Digital Platform Requirements

Cisco HyperFlex: The general hosting platform

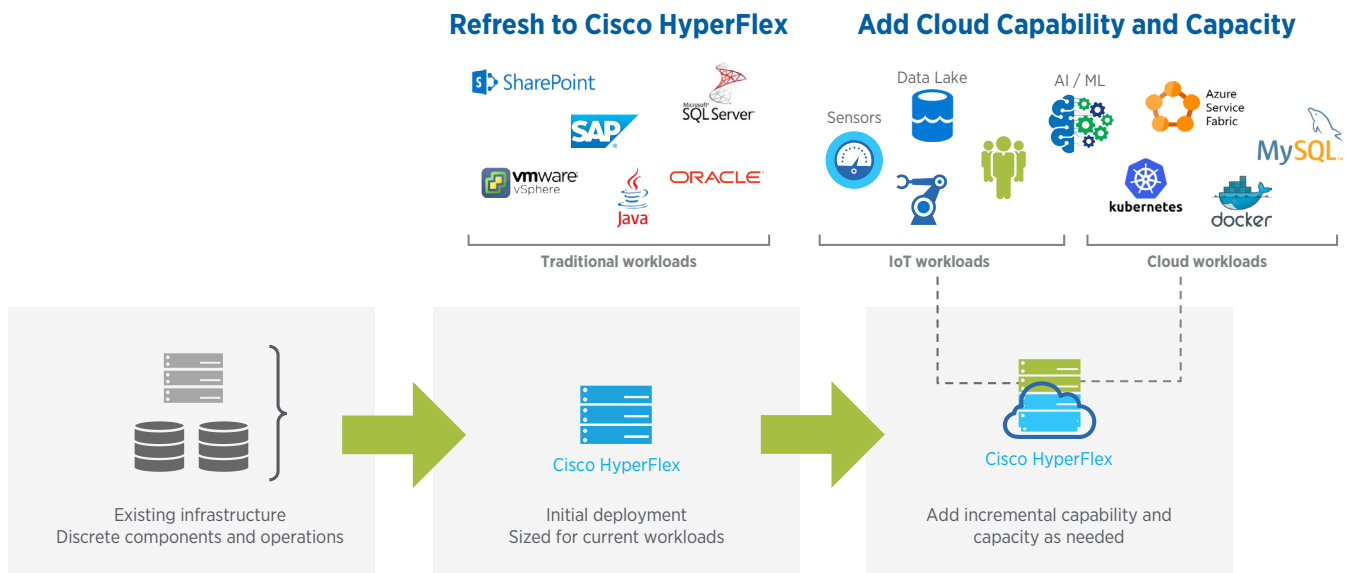

Cisco can help oil and gas companies build a bridge from where they are now in their digitalization strategies to where they want to go in the future. To that end, IT and business unit teams can start the transition from legacy systems using Cisco technologies.

Refresh today to save money and prepare for cloud and IoT

It is easy to scale the capacity and capabilities of Cisco HyperFlex

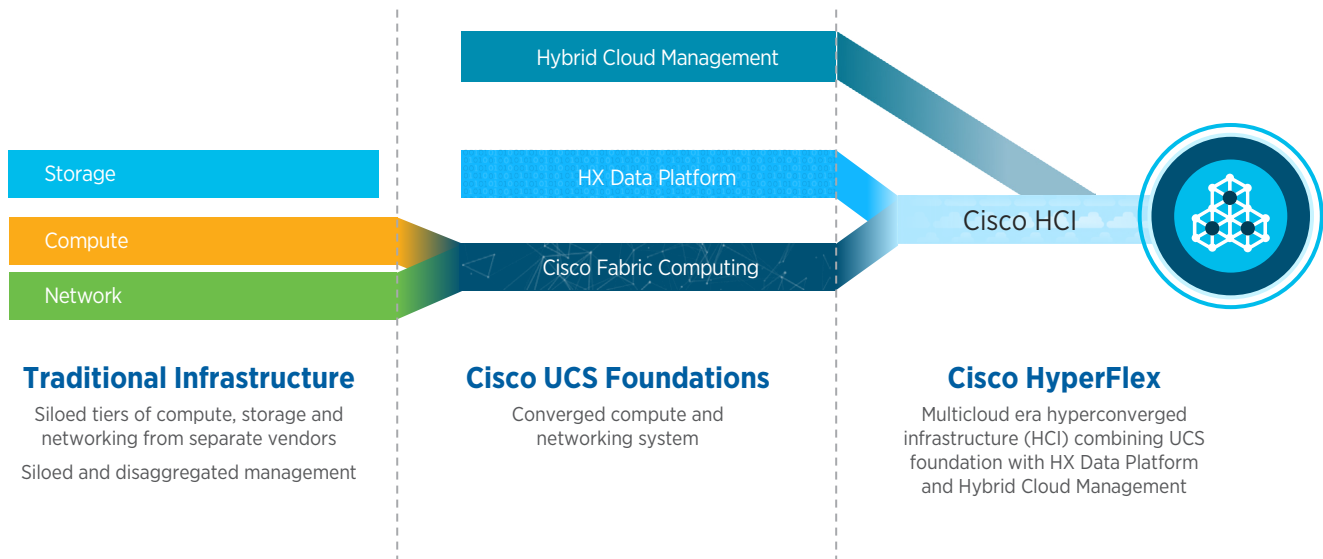

Cisco HyperFlex also offers many advanced capabilities including modernizing applications for a cloud native environment. For example, the Cisco Container Platform for Cisco HyperFlex seamlessly provides an environment for container orchestration, networking, management, and analytics – all in an open Kubernetes distribution. As a company advances on application modernization, cloud workloads, IoT processing, and data lakes, Cisco HyperFlex is more than ready to meet the challenge.

Cisco HyperFlex scale-up architecture
Add capability and capacity when needed

Modernize today to Cisco HyperFlex platform

Complete Hyperconvergence—Compute, Network, HCI Software Engineered Together

Cisco HyperFlex is a cloud-enabled hyperconverged platform which offers flexible computing, network, and storage resources that are easy to deploy, scale, and maintain.

Cisco HyperFlex is an adaptive platform that enables multicloud IT and powers any application anywhere with the simplicity of hyperconverged infrastructure. When deploying this solution, oil and gas companies can expect to benefit from industry-leading performance, independent scaling, support for multiple hypervisors and clouds, and flexible cluster scaling with high availability zones.

Cisco HyperFlex is built on the Cisco Unified Computing System (UCS). Cisco UCS is an advanced x86 server platform with integrated high-speed networking. If one doesn't need the storage capabilities of hyper-convergence, and simply needs the latest x86 rack or blade server, then Cisco UCS servers are recommended. Cisco UCS servers support the latest x86 innovations.

Delivering transformative benefits with Cisco HyperFlex

Requirement		Cisco HyperFlex Platform	Benefits
High-density scalable infrastructure		Runs more workloads per host than any other hyperconverged system.	• Lower costs and gain higher performance hosting • Buy less equipment, and use less space, power, and cooling
Independent resource scaling		Can grow compute, storage, network, and GPU capacity independently.	• Buy infrastructure assets for applications as needed • Avoid expensive and unused investments
Intelligent infrastructure management		Simplifies and automates IT administration and lifecycle tasks with an integrated architecture.	• Move staff from doing low-value tasks into higher-value activities
Hybrid cloud integration		Interoperates with public clouds and runs cloud workloads.	• Address data sovereignty, connectivity, and cost concerns of remote public clouds
Containerized micro-services support		Supports open source options such as Docker and Kubernetes.	• Leverage the latest innovations • Deliver digital services in more locations at lower costs
IoT, AI, and ML applications support		Hosts real-time artificial intelligence algorithms, IoT processing, and data lakes.	• Extend public cloud data lakes • Train AI models in the public cloud, run them in the field
Edge form factors and remote management		Scales from very small, ruggedized form to large data centers. At any scale and location, central IT can manage Cisco HyperFlex.	• Run applications close to the work, workers, data, and customers • Support field, retail, shipping, edge computing, and data hosting

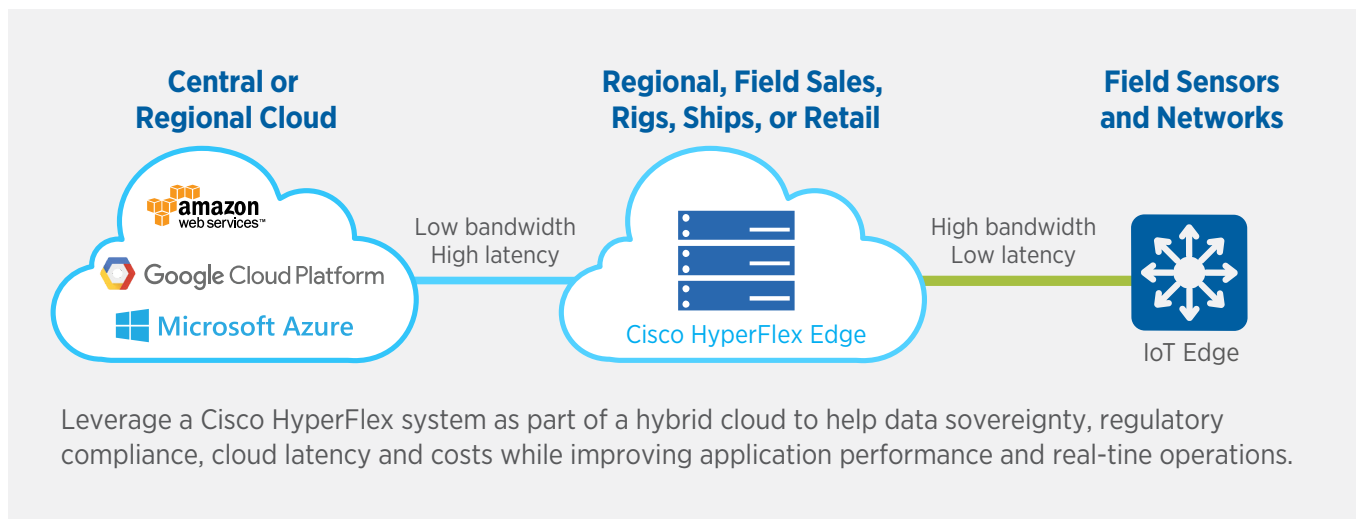

There is tremendous flexibility in a Cisco HyperFlex deployment, which will deliver long-term value and ROI for companies globally, no matter where they are on their journey to the cloud and a digital platform.

Interoperability with public clouds

Cisco HyperFlex is ideally suited for an on-premise application hosting environment, because it runs both traditional workloads and cloud native ones. It is a natural complement to the public cloud capabilities of Microsoft Azure, Google Cloud Platform, or Amazon Web Services.

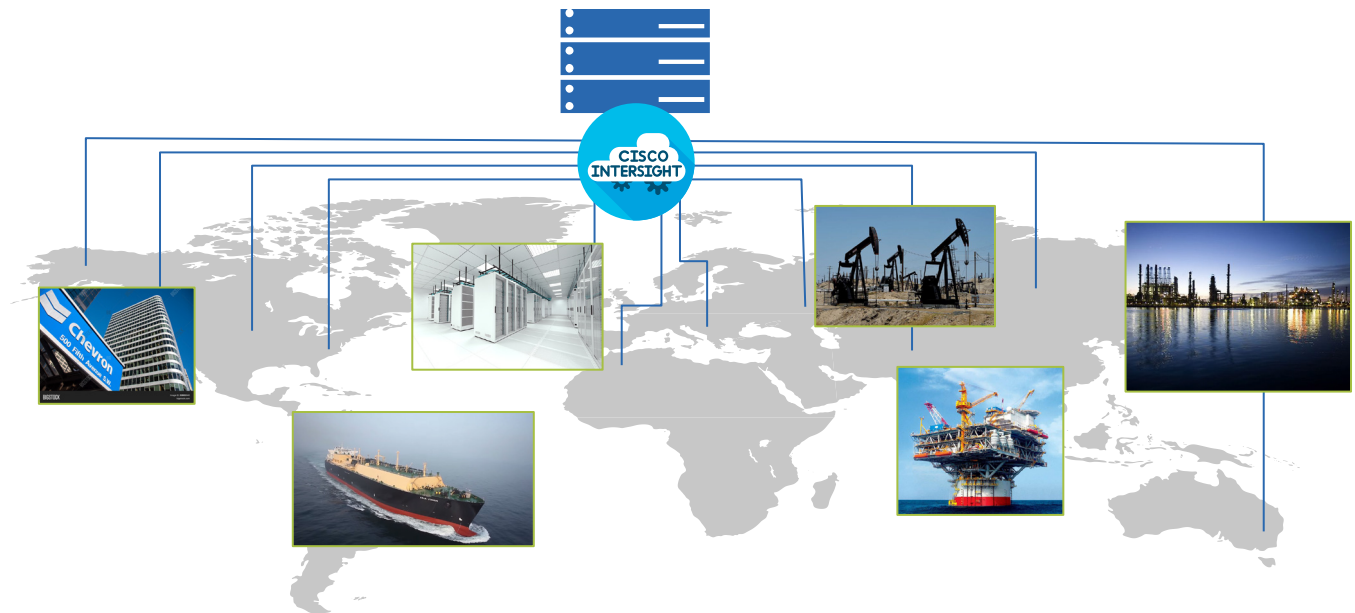

Digital Platform

Accelerated deployments of Cisco HyperFlex – From the smallest to largest footprints

Getting started with Cisco HyperFlex is easy as it requires minimal investment, leverages existing skills, and can be installed and operated remotely. To accelerate deployments and simplify ownership, companies have the option to use Intersight for Cisco, which can increase productivity by 30% and improve collaboration by 35%.

Global Deployment
